

Waterfree Urinals

Waterfree is committed to helping businesses reduce both energy costs and environmental impact through the use of Waterfree urinals. Our retrofit system eliminates waste and reduces costs. Typical savings are over £150 per urinal, per annum.

Why Go Waterfree?

Costs

Not only is excessive flushing a huge waste of precious water, urinals often cost over £300 per year in water.

Odour

The water seal designed to prevent odours escaping from the pipework can dry out or be lost due to siphonage, this can lead to foul odours.

Blockages

Blockages occur due to uric salt and limescale buildup in the pipework. Electronic flush controllers have been used to reduce water consumption. However, less frequent flushing causes build-up to occur more rapidly.

How we are Waterfree?

Dual Odour Solution

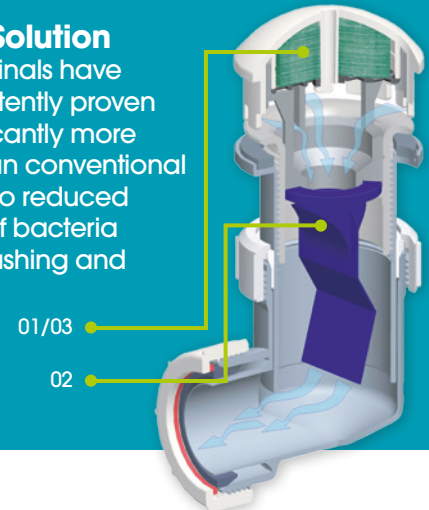

Firstly, above the bowl, odours are neutralised by our patented malodour counteractant in the cartridge (01). Secondly, the unique non-return valve ensures that odours are not emitted from within the pipework below, as it acts as a physical seal. (02).

Blockage Solution

The patented cartridge contains bespoke 'friendly' bacterial cultures that produce enzymes that help break down the uric salts so they cannot solidify and cause blockages (03). The cartridge also has a debris catcher that prevents foreign debris passing into the pipework.

Hygiene Solution

Waterfree urinals have been consistently proven to be significantly more hygienic than conventional urinals due to reduced spreading of bacteria through splashing and leakage.

Install and Maintain

The Waterfree system can be retrofitted to most new and existing urinals. Upon installation all pipework to the stack is replaced and we take ownership of the urinals through our quarterly planned maintenance regime.
